
Learn Statistics and Probability with These Helpful Q&A Documents Statistics and probability are part of the backbone of our society. Statistics help determine the outcome of an event, and give us a clear understanding on things like: which online search engines get the most traffic, how many people live in each state, and what is the death rate for women in different age groups. Without statistics we would not be able to assess risk or make educated decisions based on facts that do exist. Statisticians also routinely work together to solve problems such as predicting future outcomes before they happen --such as figuring out what could happen after a nuclear attack--to mitigate risk in strategic areas such as medicine or finance. Statistics and probability have always been a useful set of tools that have been used in every career to better understand the world around us. Studying these topics can be a very interesting and rewarding experience for everyone. The field of statistics requires a basic understanding of algebra and arithmetic, as well as a good grasp on how to use basic formulas to arrive at difficult results. Also, because mathematics is so widely used, statistics students will encounter questions from advanced areas such as quantum mechanics or complex analysis, which require knowledge beyond the scope of most introductory texts. In this blog article, I discuss different sources you can look at to learn math topics, including basic algebra and probability theory. Statistical Learning – a Field for Change What have I been working on lately? Over the past year, I have been actively involved in the statistical learning area. It is a very popular research area that has a lot to offer to statistics students and those who want to learn more about data analysis. The way statistical learning works is you're always experimenting with different scenarios, trying to come up with alternative results. In my opinion, an active understanding of this area gives you a much broader perspective as a statistician. One important thing for you to keep in mind as you read this article is that no matter which sources I mention here, they can be used as stepping stones towards your own research interests. I would also recommend you practice doing stats exercises to allow you to level up your skills. Statistics is not something that can be learned overnight. Statistical Learning Can Be Fun! I hope the sub-headline says it all: statistical learning can actually be fun! As a statistician, I think it's important for you to try things out. Don't sit down and read this whole article because you think you know everything there is to know about statistics. You need to experiment with different examples and see what works for you. This article is meant to motivate you to explore different tools that can help you in your statistics journey, and to inspire you to look outside the box and see what's out there. Get Access To Max Preps One of the best parts about statistical learning is that most of the data is made available for free online. One awesome resource I came across was MaxPreps, which has a huge sample of state level data for states such as CA, OH, NJ and many more. It has data from all sports such as football, baseball, softball and even volleyball. You can use MaxPreps to download stats or play around with online predictive models that are available on their website.
